

## 1 Inequality Practice

- (a)  $X$  is a random variable such that  $X > -5$  and  $\mathbb{E}[X] = -3$ . Find an upper bound for the probability of  $X$  being greater than or equal to  $-1$ .
- (b) You roll a die 100 times. Let  $Y$  be the sum of the numbers that appear on the die throughout the 100 rolls. Compute  $\text{var}(Y)$ . Then use Chebyshev's inequality to bound the probability of the sum  $Y$  being greater than 400 or less than 300.

## 2 Working with the Law of Large Numbers

- (a) A fair coin is tossed multiple times and you win a prize if there are more than 60% heads. Which number of tosses would you prefer: 10 tosses or 100 tosses? Explain.
- (b) A fair coin is tossed multiple times and you win a prize if there are more than 40% heads. Which number of tosses would you prefer: 10 tosses or 100 tosses? Explain.
- (c) A fair coin is tossed multiple times and you win a prize if there are between 40% and 60% heads. Which number of tosses would you prefer: 10 tosses or 100 tosses? Explain.
- (d) A fair coin is tossed multiple times and you win a prize if there are exactly 50% heads. Which number of tosses would you prefer: 10 tosses or 100 tosses? Explain.

### 3 Vegas

On the planet Vegas, everyone carries a coin. Many people are honest and carry a fair coin (heads on one side and tails on the other), but a fraction  $p$  of them cheat and carry a trick coin with heads on both sides. You want to estimate  $p$  with the following experiment: you pick a random sample of  $n$  people and ask each one to flip his or her coin. Assume that each person is independently likely to carry a fair or a trick coin.

1. Given the results of your experiment, how should you estimate  $p$ ?  
(*Hint*: Construct an (unbiased) estimator for  $p$  such that  $E[\hat{p}] = p$ .)
2. How many people do you need to ask to be 95% sure that your answer is off by at most 0.05?

### 4 Planetary Party

- (a) Suppose we are at party on a planet where every year is 2849 days. If 30 people attend this party, what is the exact probability that two people will share the same birthday? You may leave your answer as an unevaluated expression.
- (b) From lecture, we know that given  $n$  bins and  $m$  balls,  $\mathbb{P}[\text{no collision}] \approx \exp(-m^2/(2n))$ . Using this, give an approximation for the probability in part (a).
- (c) What is the minimum number of people that need to attend this party to ensure that the probability that any two people share a birthday is at least 0.5?
- (d) Now suppose that 70 people attend this party. What is the probability that none of these 70 individuals have the same birthday?
